Distribution of water surfaces on Earth

HYDROSPHERE: EARTH'S WATER SPHERE

Earth's surface

Total mass:

1.4×10^{18} tons

Total volume of water on Earth:

1,386 million km³

71% water

29%

Area covered by ocean:

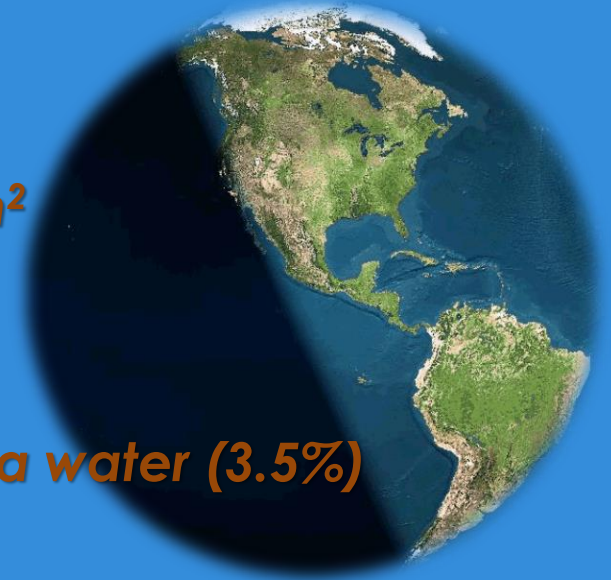

land

361 million km²

Average salinity of Earth's oceans:

35 gm/kg of sea water (3.5%)

- ▶ Contains approximately 1.4 billion km³ water
- ▶ Over 97% water is in the oceans

EARTH'S WATER RESOURCE

- | | |
|--------------------------------|--------------------------|
| ≈ Ocean water: 97.2 % | ≈ Inland seas: 0.008 % |
| ≈ Glaciers & other ice: 2.15 % | ≈ Soil Moisture: 0.005 % |
| ≈ Groundwater: 0.61 % | ≈ Atmosphere: 0.001 % |
| ≈ Fresh water lakes: 0.009 % | ≈ Rivers: 0.0001 % |

▶ Water Resources

EARTH'S WATER RESOURCE

0.023%

Water accounts for a mere 0.023% of the earth's total mass.

Of that, only a small percentage (about 0.3 %), is even usable by humans. The other 99.7 percent is in the oceans, soils, icecaps, and floating in the atmosphere.

Still, much of the 0.3 percent that is useable is unattainable.

FRESHWATER DISTRIBUTION

Water Resource Management

WATER RESOURCE MANAGEMENT

Water Resources Management (WRM) is the process of planning, developing, and managing water resources, in terms of both water quantity and quality, across all water uses. It includes the institutions, infrastructure, incentives, and information systems that support and guide water management.

Challenges in WRM

CHALLENGES IN WRM

According to World Bank estimates,

This is where, Data and Information systems are needed for an **Integrated Water Resource Management Scheme**, in sectors of -

- ✓ Water Resource Monitoring,

- ✓ Decision Making Under Uncertainty,

- ✓ Systems Analyses,

- ✓ Hydro-meteorological Forecast And Warning

GIS in WRM

WATER QUALITY ANALYSIS

- Water quality modeling
- Use of GPS / photographic tie-points
- Use of passive and active water quality monitoring systems

WATERSHED MANAGEMENT

- Terrain modeling
- Flow modeling
- Debris flow probability
- Stream Order Analysis

FLOOD MANAGEMENT

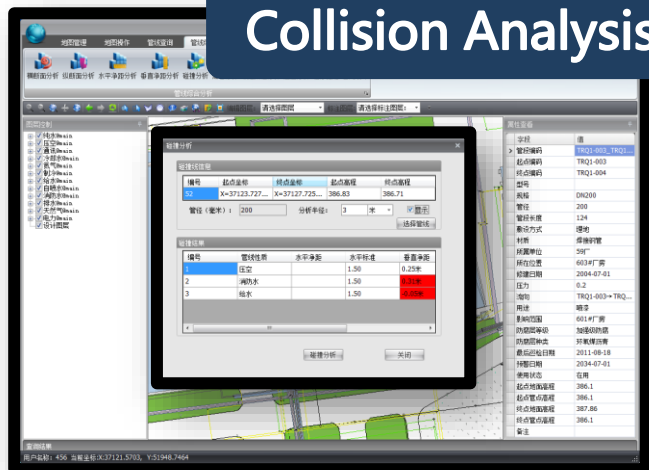

- Flood plain delineation
- Channel characteristics
- Inundation modeling
- Infrastructure analysis
- Risk modeling and mitigation

HYDRO GEODATABASE

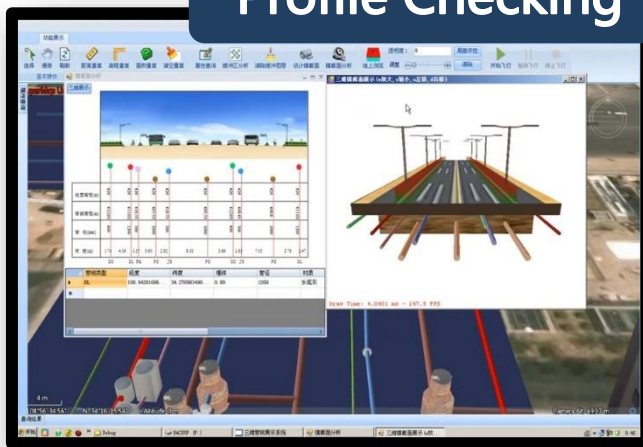

GROUNDWATER MODELING

- Modeling subsurface, flow – rate, advection, concentration
- Well and spring models.

Collision Analysis

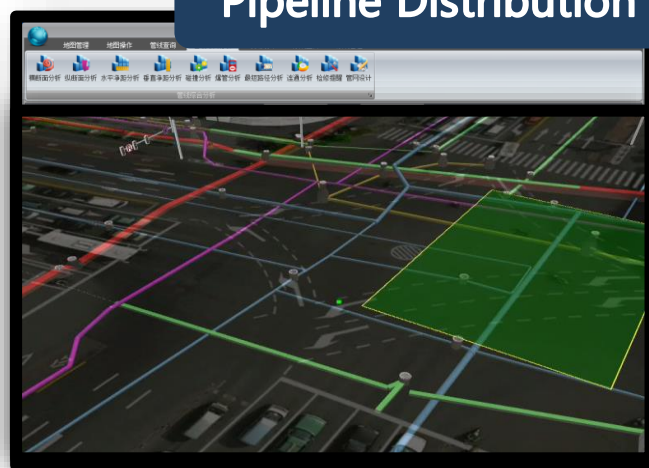

Profile Checking

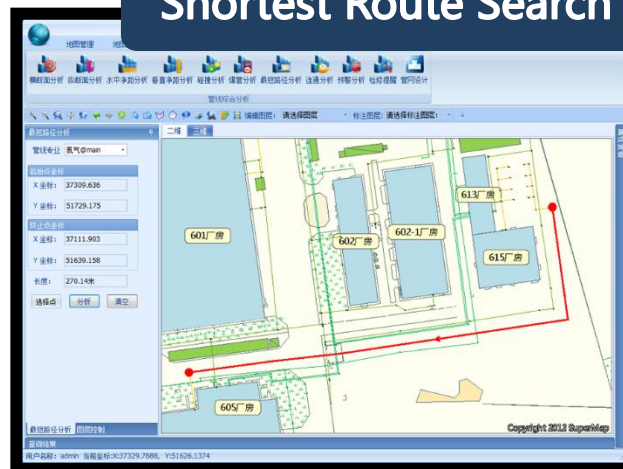

Burst Simulation

Pipeline Distribution

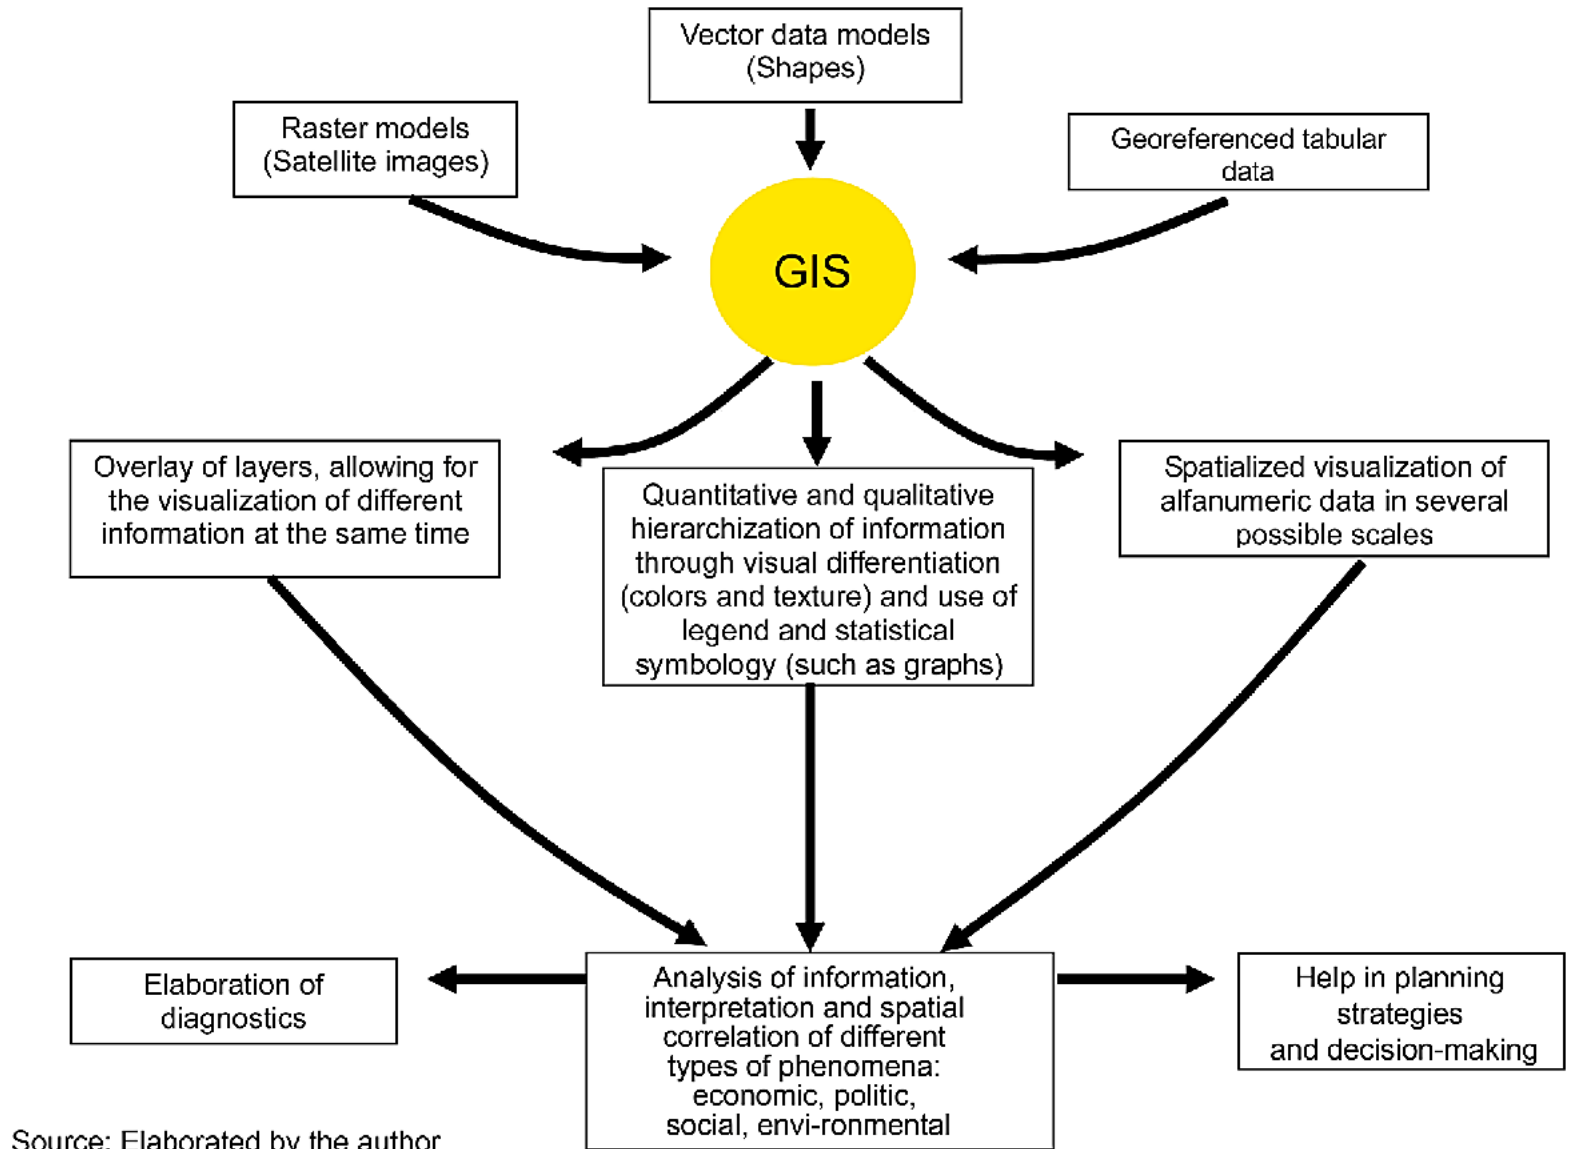

Shortest Route Search

Pipeline Excavation

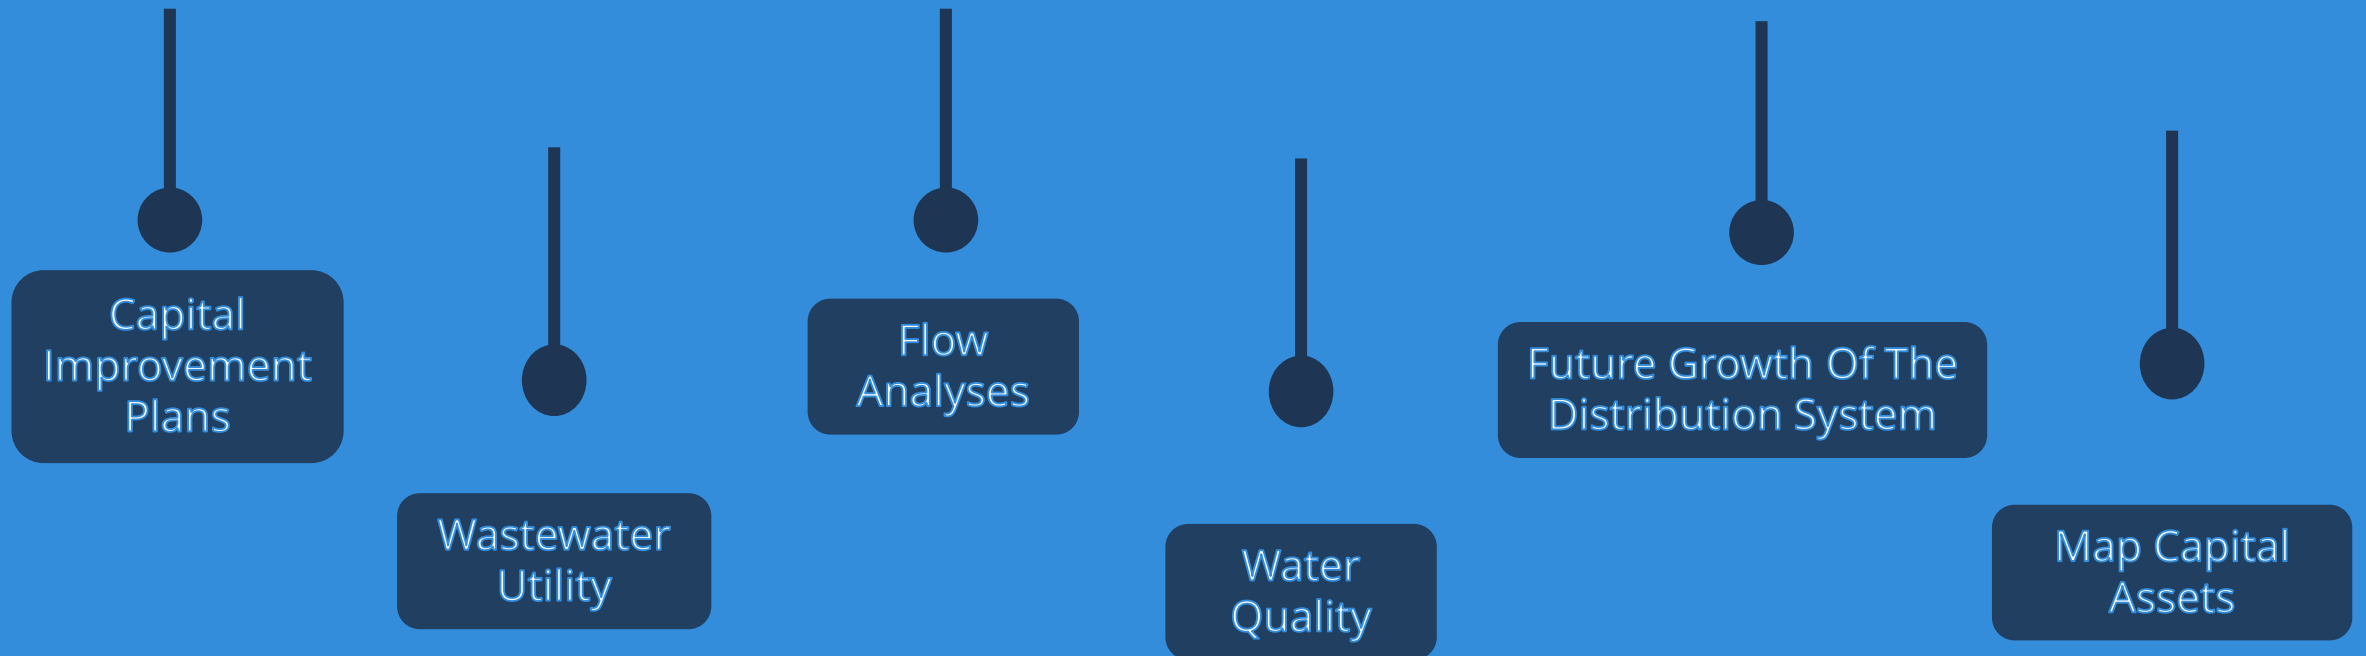

APPLICATION MECHANISM OF GIS IN WRM

GIS Hydro Modeling

It efficiently parameterizes input data of various hydrologic and water quality models to represent spatial and temporal characteristic of factors affecting hydrologic components (surface, subsurface, groundwater, etc.) and pollutant generation (nonpoint pollution) and transport with water via surface or infiltration, thus flowing into streams.

The image features a dark blue background with a complex, glowing network of blue and white lines and dots, resembling a molecular structure or a data network. The structure is spherical and composed of many interconnected nodes and edges, creating a sense of depth and complexity. The text "THANK YOU" is centered in the middle of the image in a bold, white, sans-serif font.

THANK YOU
